

Shake bottle vigorously 10 times before drawing 10ml dose (every time you use it). Give your horse STOP 20 on an empty stomach or as far from its meals as possible. First 20 days: 10ml oral of STOP 20 twice a day during the first 10 days and then 10ml once a day during the following 10 days. Avoid great efforts for the first 10 days of supplementation; do not gallop or breeze for the first 10 days. Only very light training (walking and/or jogging) can be practiced during the first 10 days. Normal training can be resumed during the second 10 days of supplementation. Your horse is ready to race at any moment after day 20.

We strongly recommend administering the dose under the tongue to allow for maximum absorption. Keep this product away from sources of energy, heat and light. Do not mix different products in the same syringe.
