

Read and Follow Label Directions

Durasole is formulated and intended for use only on the equine frog and sole. When applying, wear safety lenses and liquid impermeable gloves. Do not breathe vapors. Do not smoke, eat, or drink while applying. Harmful or fatal if swallowed. If spilled on skin, remove immediately with isopropyl alcohol; if splashed in eyes, flush with water and seek medical attention immediately. Keep out of reach of children. Flammable, keep away from sparks or open flames.

To Toughen the Sole & Frog

Clean the foot with a hoofpick, paying careful attention to the lateral and medial ulcus of the frog, followed by vigorous wire brushing of entire solar area. For maximum effectiveness, sole and frog must be clean and dry before product is applied.

Apply Durasole dropwise, disperse with brush (old toothbrush) until entire sole and frog are darker in color. Apply twice daily for the first week; once daily during the second week; twice weekly thereafter

To Transition from Shod to Barefoot

Clean the foot with a hoofpick, paying careful attention to the lateral and medial sulcus of the frog, followed by vigorous wire brushing of entire solar area. For maximum effectiveness, sole and frog must be clean and dry before product is applied.

Apply Durasole dropwise, disperse with brush (old toothbrush) until entire sole and frog are darker in color. After shoes are pulled and feet are first trimmed, apply three times daily for the first two weeks; twice daily during the third week, once daily during the fourth week; twice weekly thereafter

To Achieve Fastest Results

Clean the foot with a hoofpick, paying careful attention to the lateral and medial sulcus of the frog, followed by vigorous wire brushing of entire solar area. For maximum effectiveness, sole and frog must be clean and dry before product is applied.

Use a hair dryer, heat gun, or similar tool to completely dry the frog and sole, apply Durasole while the solar surface is still warm and disperse with a brush (old toothbrush) until the sole is uniformly discolored, the solar surface of the hoof is fully saturated and product begins to pool instead of being absorbed. You will be amazed at the results!

Repeat the process: Wire brush, heat, apply Durasole, spread with brush until solar surface of foot is completely saturated. After two or three applications, your wire brush will begin to skid across the sole instead of roughing its surface which means Durasole is causing the cell membranes of the exfoliating sole to thicken and swell; in effect, forming a living pad.

Repeat the above process as outlined at least six times daily during the first week; four times daily for the next two weeks; then twice daily as long as the horse is in training. The results will be both immediate and long lasting.
